

Mohammad Ramdzuanny
CU5 Project Proposal
Cybersecurity Threat Detection Model

Overview

This project is to develop a machine-learning model that classifies types of cybersecurity attack based on several criteria.

Dataset: Dataset are taken from Kaggle:

<https://www.kaggle.com/juanschafle/cyber-attack-detection-using-network-traffic>

<https://www.kaggle.com/dhrubangtalukdar/cybersecurity-threat-detection-dataset>

Workflow

This project will follow the following workflow:

1. Import data from Kaggle
2. Clean and preprocess the data
3. Perform exploratory data analysis (EDA).
4. Train a machine-learning model for emotion classification.
5. Evaluate the model using appropriate performance metrics.
6. Demonstrate the final model and the performance.
7. Explore how the trained model can be integrated with existing cybersecurity measures

Deliverables

- Jupyter Notebook (.ipynb + PDF) with full data cleaning,
- EDA, modeling and evaluation
- Demo presentation on the model's final performance
- Presentation slides
- GitHub repository link
